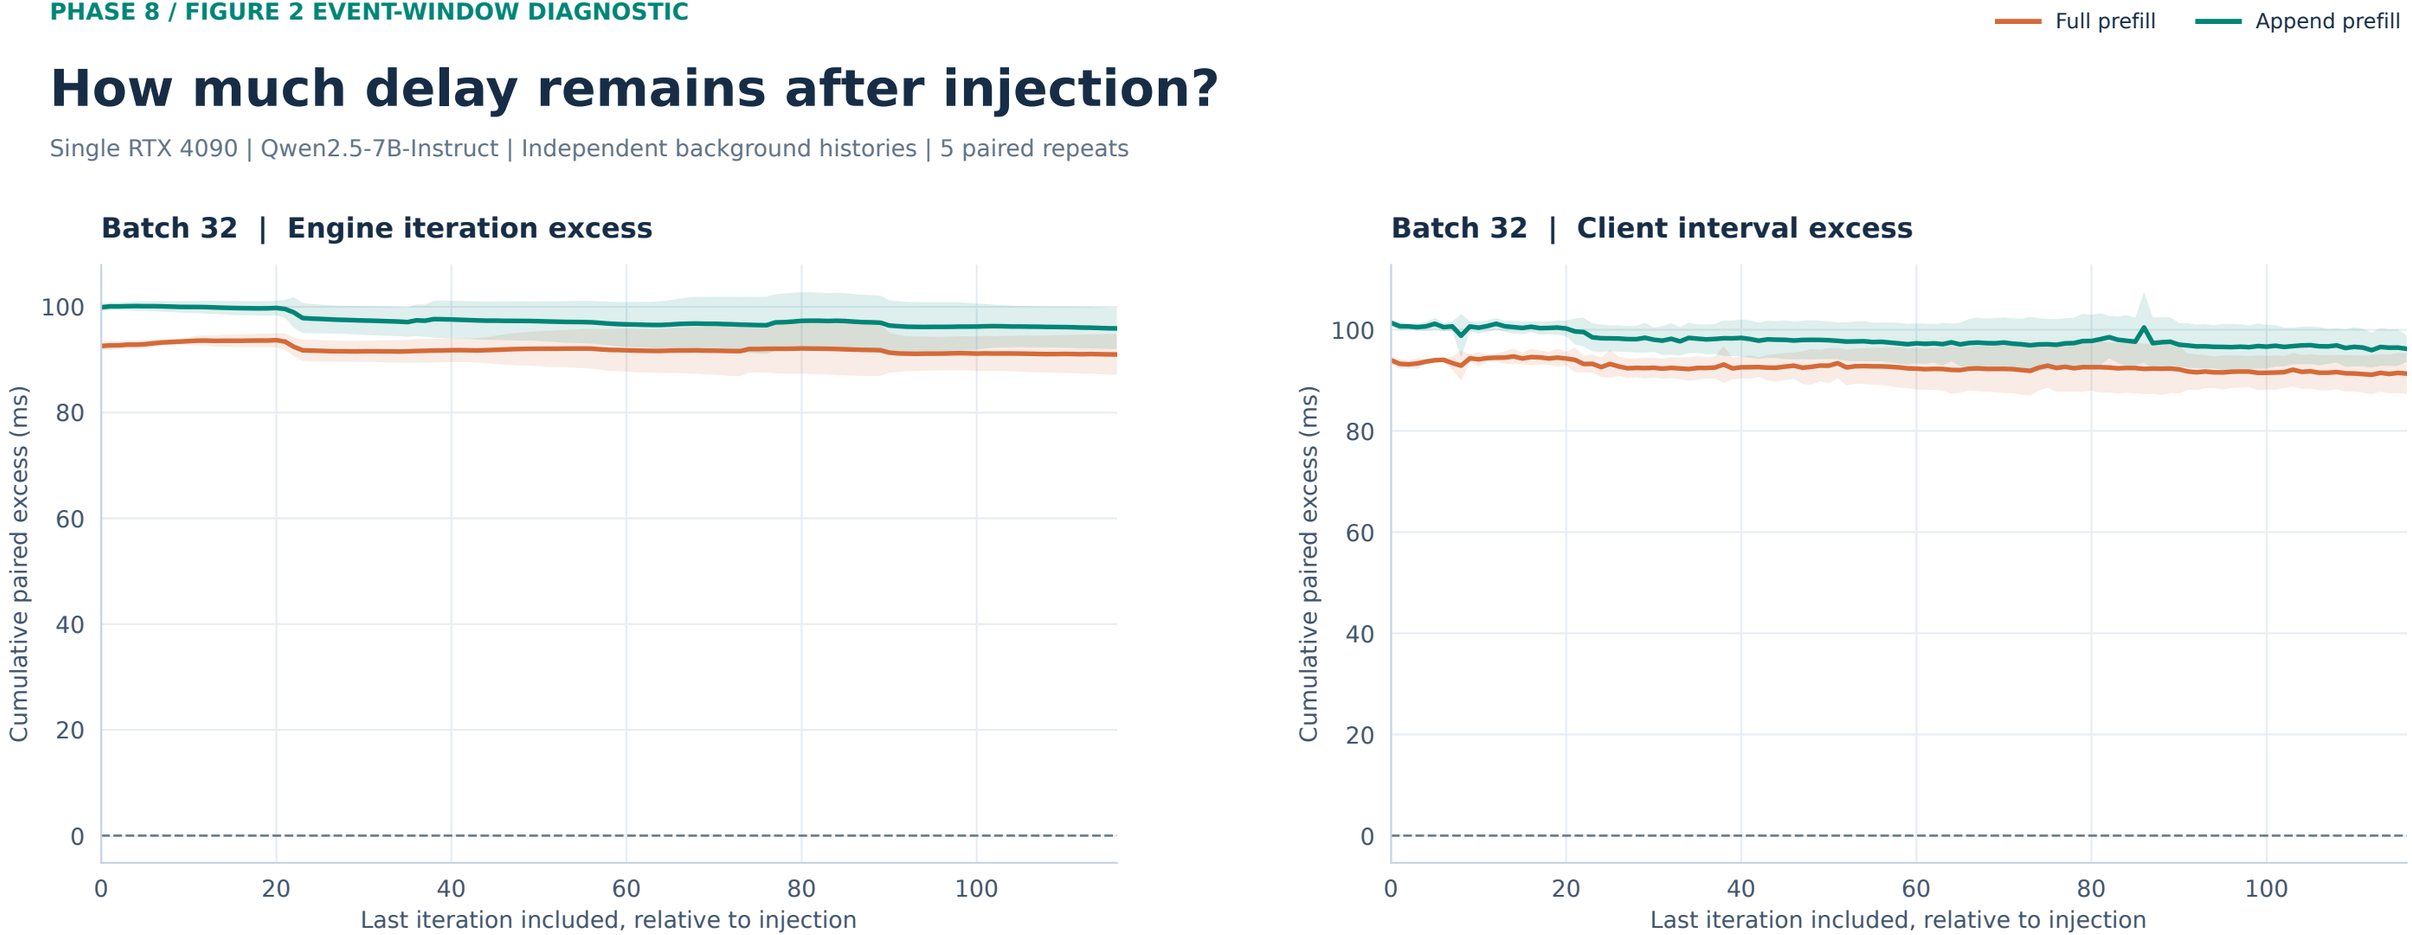
PHASE 8 / FIGURE 2 EVENT-WINDOW DIAGNOSTIC

How much delay remains after injection?

Single RTX 4090 | Qwen2.5-7B-Instruct | Independent background histories | 5 paired repeats



Signed differences are summed from step 0: slower steps add delay and faster steps subtract it. Shading = SD of trial cumulative sums, n=5.
Curves end at the last common full-batch, matched step across both scenarios and all five repeats. Partial-batch tails remain in the derived audit CSV.
A plateau indicates little net additional delay; it does not prove every subsequent step is unaffected. Later spikes and host/observer stalls are retained.
