PHASE 8 / FIGURE 2 EVENT-WINDOW DIAGNOSTIC

The stall appears at injection

Single RTX 4090 | Qwen2.5-7B-Instruct | Independent background histories | 5 paired repeats

Offset 0 = actual mixed scheduler step. Matched controls use the same repeat, request index and output-token ordinal. Shading = sample SD, n=5.
Engine iteration includes scheduling/host overhead. Client intervals are singleton token-ID SSE arrival gaps; neither is pure GPU kernel time.
Shared-history and independent-history runs are separate. The local window is a diagnostic; it is not claimed to be the paper's measurement window.
